

*by J.C.Smith and P.J.M.Irvin*

## LOADING EXILE

### AMIGA

Insert the game disk in drive **DF0:** at the *Workbench* prompt. Once the title screen has fully appeared and the music is playing, you may press the **Space Bar** or joystick fire button at any time to begin the game. Press **F10** in the game to select between different foreign languages for the text messages.

### ATARI ST/STE

Insert the game disk in drive **A** and reset the computer. Once the title screen has fully appeared and the music is playing, you may press the **Space Bar** or joystick fire button to continue loading the game. Press **F10** in the game to select between different foreign languages for the text messages.

### COMMODORE 64

Cassette users should hold down the **Shift** key and press **Run/Stop**.

Disk users should type **LOAD ":",B,1** and press **Return**.

## THE STORY SO FAR

After yet another dangerous mission on yet another inhospitable alien planet, you lie back in the commander's seat on the deck of your space-craft and look forward to being warm and comfortable on planet Earth once again. In your heart of hearts you know that one day soon you will get the calling, that indescribable urge to explore new galaxies, discovering new planets and naming them after your favourite cartoon characters. But for now, you tell your commander's seat to recline to near-horizontal, call up *'Earth Sound Effects - Babbling Brooks IV'* on the ship's hi-fi, close your eyes and think of home.

The relaxed harmonious environment of your ship is suddenly interrupted by a crackling on the speakers. The *Incoming Distress Signal* message is projected onto the main display screen, along with hundreds of seemingly random statistics. Suddenly the sub-ether comms link is activated...

"This is Commander Sprake of the Columbus Force Ship Pericles, on a mission to colonise the planet Phoebeus. Here's the data..."

The screen in front of you fills with even more numbers. You'll analyse them later, you think to yourself.

Of course, you know all about the Columbus Force. After all, they gave you the training and experience that has kept you alive so far. They perform the most dangerous part of any colonisation procedure - the initial setting up of a base. The rewards are immense, but they work with little, if any, back-up.

You continue to listen to the disembodied voice extracted from the ether.

"We're in real trouble down here. You must help. Not for our sake - we may be dead by the time anyone picks this up - but you *must* stop Triax! Please read this information..."

The screen flickers. It now shows an old news bulletin about a genetic engineer who was found to be tampering with the brains and bodies of helpless victims, turning them into ruthless terminators. He called himself *Triax*. He was convicted and sent into space for punishment, destined to drift helplessly in the infinite void for the remainder of his life. You look at the date of the report. It is over a century old - surely Triax should be long dead by now. Yours thoughts are almost immediately answered by the Commander's voice.

"He somehow managed to land here and start his experiments again. He has extended his own life - although he looks under 40, he is actually over 150 years old.

"We didn't initially realise that anything was wrong, since he had hidden himself in the Western tunnel system, beneath a seemingly impenetrable door. The planet is riddled with caves and tunnels, excavated by an ancient civilisation now reduced to some pitiful imp-like creatures. We set up base in some of the caves, away from the vicious winds on the surface.

"We dismantled a large section of the Pericles for materials, as standard procedure for colonising a new planet. It seemed safe for us to do so. The worst things we found were some kind of giant wasps, but they usually seem to stay out of the way, close to their nests."

You shudder with revulsion - you have always hated wasps! For the first time you regret losing all of your weapons in your close escape from the Acid Creatures of Ravinox 5. But you will have to try to help. After all, where would humanity be without having the explorers and colonists of the Columbus Force to satisfy its insatiable appetite for expansion? And they'd pay good money too - you wouldn't need to sell your valuable personal transporter if you could rescue the Columbus Force personnel, or avenge their deaths! You listen on intently...

"We knew something was terribly wrong when our Destinator went missing, leaving us no choice but to stay and explore further. We found that the mysterious western door had opened - the entrance to Triax's domain. The screams of the doomed exploration party still seem to be echoing around this hateful place. They had our plasma gun and the latest PX312 Blaster weapon with them, but it did them no good against the sheer magnitude of Triax's evil creations."

You have heard of the PX312, but have only dreamed of possessing one. It emits a blast of energy in all directions without effecting the user. If only you could find it, and the plasma gun too. You'd have to get through that western door first, though.

"There are terrible creatures down there, the result of Triax's vile experimentation. His lab is very deep down. He is creating a race of maggot creatures to infest the universe. He has a giant machine manufacturing them. You must destroy it! He must be stopped! Anyone! You must come! For pity's sake...!"

Sprake's voice, up to now the unnaturally calm voice of a condemned man, seems to lose control. There are confused noises in the background, panicked voices intermingled with sporadic laser shots. Sprake barks out some futile orders in desperation, then there is a loud crashing sound, followed by a still silence. You hear the distinctive sound of a Transporter materialisation, then a new voice, filled with evil and malice.

"Finally I have you, Sprake. You and your surviving crew will make fine fodder for my experiments. Humans are so much more interesting than the stupid imps and maggots I've been forced to use for the last hundred years. Come, we will now go to my laboratory."

All thoughts of the warmth and comfort of Earth are now forgotten. You are heading for Phobos...

### SECURITY SYSTEM

A lot of time and effort has gone into the development of EXILE. Unfortunately there are some members of the community who are dishonest enough to make or accept illegal copies of the game. In an effort to discourage this theft, a security system has been incorporated.

On some occasions you will need to enter a code (in the sealed eavern with the font indicators on the Amiga and Atari ST, or in the Save Position option on the Commodore 64). To continue playing EXILE you will need to enter a special code which can be found on the lower half of the packaging.

A font digit code number is displayed on the screen. Locate this number by looking along the right hand column of numbers on the inner edges of the packaging (if you are having trouble finding the number, you will notice that they are printed in ascending order).

Assigned to each Index number are two codes, one to the left of the Index number on the outer edge of the packaging, and one to the right of the Index number on the inner edge of the box. The Amiga and Atari ST versions of the game have an animated icon which indicates which of the two codes (inner or outer) should be used, whereas the Commodore 64 version tells you either **Inner** or **Outer**.

Once you have located the correct code you must enter it, either by using the spaceman to hit the corresponding digit on the Amiga or Atari ST, or by typing the number directly on the Commodore 64.

For example, if you are given the code **1354**, the two codes are **0878** (Outer) and **5496** (Inner).

If you are using a pirated copy of EXILE, watch out! The game will modify itself subtly to stop it playing correctly as the game progresses, so it may not be immediately apparent that something is wrong. You will enjoy playing the game much more if you have bought a genuine copy!

## THE AIM OF THE GAME

When the game begins, you will find yourself in your spacecraft above the planet Phoebus. You will see Triax materialise and steal your Destinator

Your ship is helpless without the Destinator - there is no other way of tracking the sub-space fractures which make intergalactic travel possible. The ultimate aim of the game is to destroy Triax's Maggot Machine, recover your Destinator, and bring it back to your ship, at which point you will blast away from Phoebus. You will get a large bonus for each member of the original landing party that you rescue from captivity in the process.

Before you can complete the task, there are many problems to overcome and puzzles to solve. There are often several ways of doing something. You must explore as much as possible, and you may experiment freely with anything in the environment. If you find yourself stuck, go back and explore - there may be something that you missed the first time. You could also try reading this manual again, since it does include many helpful hints.

## GETTING STARTED

This section describes how to complete the first part of the game. This may seem unusual, but it is an insignificantly small part of the whole game, and is a good way to painlessly introduce you to some of the main control methods used in EXILE. It is not the definitive method of completing this part of the game - you can, for example, get more grenades before going underground. Feel free to miss out this section if you want to explore by yourself.

When you arrive at Phoebus, you will see Triax teleport into your ship, steal your Destinator and then teleport away again. That is the last you will see of the Destinator for a long time! Without it your spaceship is stranded, so you need to get out and explore.

To manoeuvre, you may use either the directional thrust keys or the eight usual joystick directions.

You can see the pair of airlock doors, but they are locked. To unlock the doors, you need to press the switch near the front of the ship - just bump yourself against it. You may accidentally press the switch a second time, which will lock the doors again. Once unlocked, the doors will open when you touch them. So just stand on the top door, fall through, wait for the second door to open, fall through that, and you are out! If you now just drop straight down, you will land on the partially dismantled spaceship Pericles.

Now press the *Remember Teleport Position* key (R). Nothing seems to have happened, but your teleport circuitry (your "valuable personal transporter") has remembered your position - this will be demonstrated later. Move to the right, off the end of the ship, down onto the ground, and remember your position again. Watch out for the occasional meteorite showers!

Keep walking east (to the right) and you will find an irritating (but harmless) bird. Keep moving, and you will see a grenade. If you walk or fly against it, you will push it along the ground. You need to pick it up, not play football with it! Hold down the *Pick Up* key (<) and carry on pushing against the grenade until it jumps into your hand. Put the grenade into your pocket by pressing the *Store Object* key (S).

The bird may knock you around a bit, but it doesn't actually harm you (you will encounter much nastier birds later on!) However, you will want to get away from the bird since it hampers you. You haven't any weapons yet. I know you have a grenade, but you need to keep that until later and it's a waste using it to blast a harmless bird. So you can't kill it, you can't grab it (some animals you will be able to pick up and carry) and if you fly back to the Pericles it will probably just follow you. Here is where you can use your personal transporter...

Lead the bird to the east, until it can't fly into the wind any further, then press the *Teleport* key (T). You will be teleported back to the last position you *Remembered* (on the ground by the Pericles, well away from the bird). If you teleport again, you will end up at the position before that (on top of the Pericles). So, teleporting takes you back through the positions you have remembered with the **R** key. Only the last four positions are stored, though. If you were to teleport again, you would end up in your own spaceship, which is permanently stored as the "last resort" position, which you can always get back to in case of a dire emergency. You will also be automatically teleported if your health is very low (it never lets you die - a valuable piece of equipment indeed!) - Read the **Teleporting** section of this manual for more details.

Now fly back onto the ground to the east of the Pericles, press **R**, then fly to the left, under the ship. You will see a passage down into the ground, protected by a defence gun. If you are quick, you will be able to get down the hole without getting "killed" (i.e. teleported back to the surface). If you are killed, you should *Remember* your position (making sure you are in a safe place), and let your health recover before trying again.

Since the gun takes a while to turn its barrel to face you, it might be a good idea to try approaching from the other direction.

When you get down the hole, move quickly to the left hand end of the eave, out of sight of the gun. To the right you will see another horizontal door blocking your path down. It is locked and there is no switch to open it, but you can blow open this door with your grenade (some doors are stronger than others - this is a weak one). *Remember* your position (R) and *Get* out your grenade (G). Now fly over to the door, press **M** to drop the grenade onto the door, then go back to the left to shield yourself from the blast. After a few seconds the grenade will explode, blasting the way clear. If you are caught in the aftershock you will "die", but the only result of this is that you will be automatically teleported (having *Remembered* your position). Wait for your health to recover, re-*Remember* your position, and then carry on down into the depths of the planet. Good luck...

## THE CONSOLE

At the bottom of the screen, you will see the console (or control panel). This console shows the current status of all your vital equipment, as well as your health, score and elapsed time. It also displays important messages throughout the game.

### AMIGA/ATARIST

On the far left of the console are the four Weapons Status Indicators (numbered 1 through to 4). To the right of the fourth bar is an indicator which illuminates when your Jetpack Booster is activated. The last two vertical indicators are your Space Suit protection field status, and Jetpack Fuel remaining.

On the far right of the console, you will see the six pass-key slots. As you collect the keys from around the game, the relevant slots are filled. When you come into contact with a diim or transporter the corresponding indicator will pulse to show which pass-key is required.

Below the pass-key status area is your Health Indicator, shown in green when you are in good health. If you are injured, the two ends of the indicator turn red, and the red area fills towards the centre until finally you are so badly hurt that you are automatically teleported away.

In the centre of the console is the EXILE panel. It will begin to glow if you are injured, and also if you jetpack becomes clogged up with mushroom spores (see later in the manual for more information on the mushrooms). This area also contains the joystick control icons (accessed by pressing the **Space Bar**).

To the left of the EXILE panel you will see your score and to the right the elapsed game time. Below the panel is the scrolling message window.

On the far left of the console are the six horizontal Equipment Status Indicators. The top indicator shows the amount of Jetpack Fuel remaining. The next four bars are your Weapons Status Indicators (numbered 1 through 4). The sixth indicator shows your Space Suit protection field status.

On the far right of the console, you will see the six pass-key slots. As you collect the keys from around the game, the relevant slots are filled. When you come into contact with a door or transporter the corresponding indicator will pulsate to show which pass-key is required.

Below the pass-key status area is your Health Indicator, shown in white. This indicator reduces as you get injured, until finally you are so badly hurt that you are automatically teleported away.

In the centre of the console is the EXILE panel. It will begin to glow if you are injured, and also if your jetpack becomes clogged up with mushroom spores (see later in the manual for more information on the mushrooms). To the right of the EXILE panel is an indicator which illuminates when your Jetpack Booster is activated.

Below the EXILE panel you will see your score and underneath that is the elapsed game time, shown in days, hours, minutes and seconds. Below the elapsed time panel is the scrolling message area and to the left are the joystick control icons (accessed by pressing the **Space Bar**).

## THE CONTROL SYSTEMS

The following section of this manual describes all the controls used in EXILE. You have greatest flexibility when you use the keyboard, but you can use a joystick for thrusting and firing, together with the keyboard for the extra functions (throwing, dropping, etc...). At first the number of keys available may seem daunting, but if you persist it will soon become second nature.

**Note:** Due to a hardware limitation, the Atari ST is unable to accurately register more than two simultaneous keypresses, so you may experience a lack of responsiveness if you are trying to press three or more keys together (e.g. thrust up and left, as well as fire).

If you prefer not to use the keyboard at all you can use the joystick for everything (however, you always keep the opportunity of using the keyboard whenever you like).

The joystick control system is icon driven. You need to press the **Space Bar** to get the first icon set, press it again for the second set, then a third time to return to normal thrust control. Move the joystick to highlight the required icon, and then press the fire button to select it.

For many functions, you need to keep the fire button held down while you use the joystick to complete a selection. When you release the fire button, the joystick will revert to normal "thrusting" mode.

*Note:- If you have an auto-fire feature on your joystick, it should be turned off.*

## THRUSTING

<i>Function:-</i>	<i>Key:-</i>	<i>Joystick:-</i>
Left	<b>G</b>	Push left
Right	<b>W</b>	Push right
Up	<b>P</b>	Push up
Down	<b>L</b>	Push down

Thrusting causes a pressurised jet of air (or water, if you are underwater) to be blasted from your jetpack. You will see this jet as a stream of particles. The jetpack uses energy - its energy bar on the console shows how much energy remains. If you are standing on the ground, thrusting sideways causes you to walk or run, using no energy. If you thrust up while standing on the ground, you get an extra upward impulse by jumping. If your jetpack is out of fuel, or temporarily blocked (e.g. with mushroom spores), you can still run and jump.

## AIMING AND FIRING

Once you have found, picked up, and selected a weapon you can then fire it. It is fired in the direction you have chosen using the aiming controls (see below). Additionally, the fire key/button can affect some held objects - for example, if you are holding a grenade, you can use it to start and stop the countdown to detonation.

Holding down the fire key/button gives auto-fire on the missiles, but you can fire more rapidly by repeatedly pressing it quickly yourself.

*Note:- If you are using the joystick for thrusting, the **Space Bar** is used for icon selection, but if you are using the keyboard for thrusting, the **Space Bar** functions as the fire key.*

The **Aiming** function controls the trajectory of firing and throwing. You can raise and lower the direction (a stream of particles shows the direction of aim as you do this), and by holding the **Raise Aim** and **Lower Aim** keys together, you can show the current aiming direction without altering it.

To aim using the joystick, select the icon and keep the fire button held down. You will see a stream of particles showing your current aiming direction. Move the joystick up and down to direct it, or sideways to centralise it. When you release the button, you will return to normal thrusting mode.

## PICKING UP/THROWING/DROPPING

To pick up an object, you must hold the *Pick Up* key as you touch the object in front of you by moving into it. You may also be able to grab an object that is on your head, or under your feet, as long as it is not actually behind you. To use the joystick, select the *Pick Up* icon, and keep the fire button held down while you thrust against the object, until you have succeeded in picking it up.

Not all objects can be held, and some objects will hurt you if they are carried (e.g. radioactive crystals - until you gain radioactive immunity). On the other hand, some creatures can be held, thus stopping them hurting you (try grabbing a wasp).

*Try picking up the big fish...*

Once you are holding something, you can drop or throw it. Pressing the *Throw* key launches the object in the direction defined by your aiming trajectory. Realistically, light objects are thrown further than heavy ones. Also, thrusting and walking are slower if you are carrying a heavy object.

If you select the *Throw* or *Drop* icon with the joystick, you won't actually throw or drop the object until you release the fire button. This enables you to manoeuvre whilst you drop or throw. This can be very important, because you can throw objects faster by thrusting and throwing at the same time.

## USE OF POCKETS

You have four pockets into which you can store some carried objects. The pockets are actually stasis fields, designed so that a stored object is completely suspended in time and space (a live grenade won't explode, for example) and doesn't affect your weight.

Pressing the *Store Object* key, or selecting the *Store Object* icon, will put the object you are holding into a pocket. If this doesn't work it either means the object is too large, or all your pockets are occupied. If it is the latter, you can still use *Get Object* to see which item(s) you might want to discard.

Pressing the *Get Object* key will take an object out of your pockets and put it into your hands. If you are already holding something, the held object will (if possible) be put in a pocket first. Repeatedly pressing the *G* key will cycle through all the items in your pockets.

Selecting the *Get Object* icon with the joystick is similar to pressing the *G* key, except that if you keep the fire button held down you can cycle through the items in your pockets by moving the joystick up (just like repeatedly pressing the *G* key), or you can store the object away (like pressing *S*) by moving the joystick down. Release the fire button to return to normal thrusting mode.

## TELEPORTING

You will quickly find out the importance of your personal teleporting capability, and it is imperative that you learn to use it properly and get the best out of it.

When you teleport, you go to the last position stored with *Remember*. This position is then lost, so the next teleport will take you to the position remembered before that. You will usually want to re-*Remember* your position immediately after you have teleported, in order to keep this position intact as your destination.

Your teleport circuitry remembers only the last four positions, plus a "last resort" position, back at the ship.

You can teleport voluntarily (by pressing the *Teleport* key) or automatically (when you are badly injured, in which case you lose points). Because of this, it is a good idea to only remember your position in places which are *safe*. If you are teleported automatically, you will want to recover without something immediately hurting you, and causing you to teleport again.

You cannot teleport voluntarily if you are holding something, and if you are teleported automatically you will drop whatever you are currently holding in your hands. You may even have something drop out of your pockets, so try and teleport voluntarily before this situation occurs. If you arrive at your destination very hurt, there will be a short delay (a couple of seconds) before you are able to remember your position again. Listen for the sound effect when you press R.

You can use your teleport strategically too. For instance, to get past a creature that keeps pushing you away, you could *Remember* your teleport position, be pushed back, then *Teleport*. You will then be on the other side of the creature!

#### WEAPON SELECTION AND ENERGY MANAGEMENT

<p>Amlga/Alari ST</p>  <p>Weapon Select (Set 1, centre left)</p>	F1	F2	F3	F4	F6	F7
	Gun	Icer	PX312 Blaster	Plasma Gun	Protection Suit	Jetpack (also ESC key)

<p>Commodore 64</p>  <p>Weapon Select (Set 1, centre left)</p>	1	2	3	4	5	←
	Gun	Icer	PX312 Blaster	Plasma Gun	Protection Suit	Jetpack

Certain weapons and items (listed below) that you pick up are automatically attached to your spacesuit, and cannot be dropped again. Initially you have only your jetpack (not to be confused with the jetpack booster). These items use energy from their own batteries, but energy can be freely transferred between them. You can see how the energy is distributed by looking at the energy bars on the console. The weapon selection and charging functions have no effect until you have picked up your first weapon, and when you have picked it up you must remember to select it before you can fire it.

### Keyboard Weapon Selection

To select a particular piece of equipment you need to press the relevant key. You can transfer energy to the selected weapon by pressing **Shift** together with the key corresponding to the item from which you want energy to be taken. For example, if you have Weapon 1 selected, you can transfer energy to it from the jetpack by pressing **Shift** together with the jetpack key. You will see the energy transferred on the console. If you need to recharge your jetpack from a weapon, you need to select the jetpack first, and then press **Shift** together with the weapon key.

### Joystick Weapon Selection

Firstly, select the *Weapon* icon (Icon set 1, centre left icon) and keep the fire button held down. You can now choose your weapon by moving the joystick left and right (up and down on the Commodore 64), or you can charge/discharge the weapon by moving the joystick up and down (left and right on the Commodore 64). Release the fire button to return to normal thrust mode.

When a weapon (or the jetpack) is low on energy it will function intermittently. To gain extra energy, you need to pick up Power Pods. These are released when robots or gun turrets are destroyed, and they supply energy to the jetpack battery (from which you can charge the other items). Power pods become unstable and begin to pulsate if they are disturbed, so you should pick them up quickly before they burst into flame and self-destruct.

#### *The Gun*

This is the first weapon you will find, and fits into slot 1. It fires bullets which cause damage on impact and are quite light. It is quite a feeble weapon, but capable (with lots of shots) of stunning robots and turrets temporarily.

#### *The Icer*

This fits into slot 2, and fires explosive energy packets which do more damage than bullets. Not surprisingly, it uses more energy than the gun. It is carried by a hovering robot, which you need to destroy to get at the Icer.

#### *The PX312 Blaster*

This weapon (slot 3) causes a blast of energy away from your suit, damaging and pushing away anything that is close to you. It uses a lot of energy, though. Just watch the energy drain away as you use it!

#### *The Plasma Gun*

The weapon in slot 4 launches plasma balls (very hot charged gas), using about 10 times the energy of the gun.

#### *The Protection Device*

This item (on the Commodore 64 it is a green protection suit) gives you greater protection from anything that hits you. In doing so it uses up energy, and when it is low in energy it will lose its effectiveness, so you will revert to your normal strength. Watch the console to see when it needs recharging. The more you are being hit, the more quickly energy will be used in trying to protect you.

## SCREEN OFFSET

To enable you to see more of your surrounding environment, you can move the screen by using the cursor control (arrow) keys, or by selecting the screen offset icon and moving the joystick (with the fire button held down).

### *Amiga/Atari ST only:*

Pressing the left and right cursor keys together will centralise the screen horizontally. Pressing the up and down keys together centralises the screen vertically.

### *Amiga only:*

If you dislike the way the screen "follows" you around, try pressing **F8** which toggles to a fixed method which you might prefer.

## BOOST

These functions are only applicable once you have picked up the jetpack booster attachment. The booster gives you the capability of doubling the amount of thrust from your jetpack, although it uses four times the amount power in the process (you can see it's status on the console). Once installed, you can switch it on or off as required, and Amiga/Atari ST users can also activate it for short bursts of energy. The booster is particularly useful (if not essential) when you are trying to carry a heavy object.

## WHISTLES

There are two whistles to find and pick up. They are needed to control the friendly robot "Chatter", who is initially deactivated. When you are able to, try feeding Chatter some Coronium crystals, and then using the whistles.

## LIE DOWN

This option forces you to lie down on the ground - useful for getting through small gaps, or ducking enemy fire. To stand up again, release the key or joystick fire button.

## TURN AROUND

This option makes the spaceman turn around to face in the opposite direction. If he is lying down, he will turn to face upwards.

## REPEAT LAST MESSAGE

You will occasionally see messages scrolling along the bottom of the console. They are usually initiated when you touch something for the first time, telling you what it is. Sometimes there is a queue of pending messages waiting for you. This option will repeat the last message for you.

## MENU

The menu screen gives you the option of loading and saving positions. This is described in detail later on in this manual.

## PAUSE GAME

There is no visual indicator to show that the game has been paused, so if the game seems to have "frozen", try pressing this key!

## SCORING

To the left of the EXILE logo (below on the Commodore 64) on the console is your current score. You gain points for killing enemy creatures, and you also score bonuses for completing certain tasks, such as destroying Triax's Maggot Machine, and rescuing crew members. If you are injured badly enough to be automatically teleported, you will lose points.

Also displayed on the console is the elapsed time. This is the actual playing time taken to reach this point in the game. You lose one point per second from your score, so it doesn't pay to hang around for too long doing nothing!

## SOME THINGS YOU WILL SEE

### Doors

There are doors to be found throughout the game, hindering your progress. An unlocked door is easy to pass through - all you have to do is touch it and it will open. If a door is locked, however, you will need to either find a way of unlocking it, or you may be able to blast it open with a grenade (there is only one type of door that can be blasted in this way).

You can lock or unlock a door by using the RCD (*see below*), but only if you possess the key corresponding to that door. Sometimes there will be a switch that controls a door, or there might be an invisible trigger-point nearby which activates its mechanism. Different doors have different strengths - weak doors can be destroyed with a grenade, for instance, while the other doors require either the Cannon or a Coronium blast to destroy them. Ancient rock-doors cannot be affected by the RCD, even if you have all the keys.

### Turrets and Robots

These are easy to spot, since they shoot at you at every opportunity! If you manage to damage a robot or turret badly enough, it will start flashing, indicating that it is 'stunned'. This puts it temporarily out of action. If your weapon is strong enough you should be able to destroy it completely with a few more quick shots. It may release a power pack, or maybe something more useful when it expires.

### Imps

Imps evolved from the remnants of the ancient civilisation which originally built the underground system of Phoebeus. They are not very friendly - they bite you and throw mushrooms or other things at you given half a chance. However, if you give an imp something it likes (or even if it steals something) it may give you something useful in return.

### Switches and Trigger Points

You have already encountered a switch in your spaceship. Switches can lock and unlock doors, open and close doors, enable and disable transporters, and even change transporter destinations.

You may be walking or flying through what seems like an empty tunnel, then suddenly there is a sparkling effect, and a door opens or closes. You have encountered an invisible trigger-point. You can sometimes leave an object in the trigger area to keep the effect going (e.g. keeping a door open).

### Transporters

Transporters are teleport booths. Any object that touches the scan-beam gets transported to the location programmed into it. The scan-beam stops if the transporter is deactivated - either with a switch, or the RCD (if you have the correct key).

### Grenades

When a grenade is thrown or dropped, it will become "live", exploding a few seconds after the countdown begins. You can start the countdown without dropping the grenade by pressing the *Fire* key. Press it again to stop the countdown. If you are quick, you can grab a live grenade, press the *Fire* key to deactivate it, and then keep it for your own use.

### The Remote Control Device (RCD)

The RCD is a vital piece of equipment that you need to locate and recover. It was dropped by a member of the Pericles down through a trap door, into a fire. It is used to lock and unlock doors, or activate and deactivate some transporters.

To use it, aim it at the centre of the door or transporter (using the *Aim* keys), and press the *Fire* key. You will hear a sound and see it emit a particle stream, showing that it is functioning. Each door and transporter has its own activation code, which means you need the correct pass-key in order for the RCD to have any effect. You must be close enough for this to work, and the further you are away the more care you need to take to aim it (just like old-fashioned TV remote controls found on Earth). There are two pass-keys which you can find in the early stages of the game.

If you use the RCD on a door or transporter, or touch a door or transporter beam, the corresponding pass-key slot will flash in the console. If you don't already possess it, this shows which pass-key (if any) will control that door or transporter.

*Commodore 64 only:* The doors and transporters are colour coded to their pass-keys, so for example if you have a green key, you can lock and unlock any green door and any green transporter with the RCD.

### The Cannon RCD

There is a second RCD which operates similarly to the first, except that this one fires the cannon (no pass-key is required). *Aim* it at the Cannon, then press *Fire*. Watch out for the blast!

### Fluffy

Originally a pet of one of the colonists, Fluffy is a strange alien creature who has a tendency to squeak repeatedly when frightened by loud noises such as gunfire. Once he's befriended you, he'll stick by your side through thick and thin. Fluffy is extremely agile, and can squeeze through very tight gaps to retrieve objects for you...

## Mushrooms

Mushrooms on Phoebe are really annoying, since their spores temporarily block up your jetpack nozzles. There are two types of mushrooms. Some are of a hallucinatory nature, making you fall over helplessly when you are affected by them. The others just block your jetpack - you can walk through areas of these mushrooms. After a while your jetpack will automatically unblock itself.

You can eventually protect yourself from these effects by finding and storing away a special immunity filter. Even without immunity, you can still *Pick Up and Store Away* mushrooms, since they don't always disintegrate on impact.

*Amiga/Atari ST only:* Whilst you are suffering from the effects of the mushrooms, the EXILE logo on the console flashes green.

## Coronium

Coronium is a glowing, radio-active substance. There are small, unstable Coronium crystals, and large Coronium rocks. Touching any two of these together causes an explosion, the most powerful explosion being when two Coronium rocks collide. You can manufacture Coronium crystals by burning the mushrooms.

Initially you get badly hurt if you touch Coronium, but eventually you will find a radiation protection pill which stops this happening. You will need to get a Coronium rock from the Eastern tunnel system to blow open the entrance to the Western tunnel system.

*Hint:* There is a two-stage method of converting "Slimes" into Coronium rocks.

## Sucking Clams

There are giant clams scattered around the lower regions of the tunnel system. Each clam can generate a powerful force, attracting or repelling anything in its sight (including you!). Some are fussy eaters, and only suck when they see their particular food.

## USING GUNS AS TOOLS

Everything in EXILE has mass, varying from light wasps to large heavy boulders. Winds have less effect on heavy objects than light ones. Conservation of momentum applies on all impacts, so that a fast, light object may move something as much as a slow, heavy one. Because of this, you can use your guns as tools to move heavy objects around. The second gun (the leer) has heavier projectiles than the first, so it will move things more effectively. Note, however, that this uses up energy very quickly.

Most pieces of equipment you will find (keys, RCDs, Guns, Whistles, the Caunou, the Booster, the Protection Suit, the Destinator) are indestructible, so don't be afraid of damaging them. Feel free to shoot at them or blow them up in order to move them.

If you are trying to move something heavy along the ground, it helps to aim slightly upwards as you shoot. This tends to lift the object off the ground, thus reducing friction. Aiming straight upwards as you shoot is an effective way of lifting something up into the air.

## SAVING AND LOADING POSITIONS

### Amiga/Atari ST

When you enter the menu screen (by pressing **HELP**) you are given the option of loading/saving to **DISK**, or loading/saving to **RAM**. Use the joystick and fire button or the cursor keys and **Return** to select the required option. Select **CONTINUE** to return to the game.

Saving a position to **RAM** is very useful during gameplay, since it is a good idea to temporarily save your position before trying something dangerous or tricky. Simply select **RAM SAVE** or **RAM LOAD**.

To save your position to disk you must have a blank, formatted disk to use as your EXILE data disk. You must **REMOVE YOUR GAME DISK**, place your blank disk, or a previously initialised EXILE data disk into drive **A** or **DF0**; and select **DISK SAVE**. If the disk hasn't been initialised as an EXILE disk, you will be asked if you want this disk initialised. Once the disk has been initialised, it should only be used as an EXILE data disk. You will not be able to use the disk other than from within EXILE.

When the disk has been initialised, you should choose one of the slots into which you want to save the position. Do this by either typing the slot's identification letter, or use the cursor keys and **Return**, or use the joystick and fire button. You can then type in a name, followed by **Return**, and the position will be saved. Pressing **Esc** during this process will cancel the operation.

To load a position from disk, place the EXILE data disk into drive **A** or **DF0**; select **DISK LOAD**, choose the required slot (as described above) and press **Return**.

### Commodore 64

When you enter the menu screen (by pressing **F7**) you will be given a menu choice. The first thing to do is to select your filing system by pressing **F5**. You can choose **RAM**, **TAPE** or **DISK**.

If you have **RAM** selected, you can use the computers memory to save and load positions temporarily. This is very useful during gameplay, as it is advisable to save your position before trying something dangerous or tricky. There is room for two positions, labelled **RAM1** and **RAM2**. Select **LOAD POSITION** or **SAVE POSITION** (**F1** or **F3**) then choose **RAM1** or **RAM2**.

If you have **TAPE** selected, you can use the **dataorder** to save and load positions to a blank tape. You will be asked to type in a filename. To get a catalogue of the tape, select **LOAD POSITION** then type a filename which doesn't exist (e.g. "ZZZZ"). Press the **RUN/STOP** key to return to the main menu. Make sure you don't use the program tape to save game positions!

If you have **DISK** selected, the **LOAD** and **SAVE** options will use the disk drive. You must have a formatted disk ready before you run the game (do *not* use the program disk to save positions!). Press **D** to get a directory of the disk.

## CREDITS

EXILE was designed and written by Jeremy Smith and Peter Irvin.

68000 Coding was assisted by William Reeve.

The graphics were designed by Herman Serrano (Amiga/Atari ST).

Paul "Dokk" Docherty (Commodore 64) and the Authors.

The Amiga/Atari ST title music was composed by Henry Jackman.

and reproduced on the Atari using TCB Tracker by MPH.

The sound effects are by the Authors.

Instructions by the Authors, Edited and typeset by Gary Sheinwald, Illustrations by Herman Serrano.

We would also like to thank the following for their useful involvement in the EXILE project to date:-

Andiogenic Software Limited

(Gary Sheinwald, Peter Calver, Mike Wolliston et al), for turning EXILE into a real product

Jacqui Lyons, our agent

David Braben, Jonathan Griffiths and Mark Lomas for occasional useful suggestions

Colin Fridge, for his playtesting and encouragement

Mike Wolliston, for more playtesting

Mark Cullen, for creative help with the original storyline

Amanda, for cakes and biscuits and cups of tea

William says "Thanks to LAN, for everything"

And thanks to **YOU** for buying this game. Unless, of course, you didn't.

## Summary of Exile Keyboard Controls

Function	Amiga/Atari ST	Commodore 64
Thrust Left	<b>Q</b>	<b>Q</b>
Thrust Right	<b>W</b>	<b>W</b>
Thrust Up	<b>P</b>	<b>P</b>
Thrust Down	<b>L</b>	<b>L</b>
Jetpack Booster	<b>&lt;Caps Lock&gt;</b>	<b>@</b>
Booster Burst	<b>I</b>	
Lie Down (disables jetpack)	<b>&lt;CTRL&gt;</b>	<b>&lt;RUN/STOP&gt;</b>
